Common Constraints : Case Study 2 ATM

1. Encrypting Password to store and decrypting it to validate it and restricting admin to access only account number and transaction details
2. Adding phone number to get OTP which is used as two-step verification before any transaction done (generate otp via function)
3. Joining family accounts which enables users to withdraw from their family members account
4. Add an option to transfer from one account to another by entering account number and ifsc code
5. Add a method to change PIN and other basic details
6. Store user information in a file or database
7. Provide an Option of Mini Statement to the user
